

Product Code . JL-BE-10526

Diffusion Cell Apparatus

Description

Diffusion Cell Apparatus

Description:-

The test product is applied to the membrane via the top chamber- donor compartment. The bottom chamber- receptor compartment contains fluid from which samples are taken at regular intervals for analysis. The Franz Cell consists of two primary chambers separated by a membrane. This testing determines the amount of active drug that has permeated the membrane at each time point.

The Transdermal Diffusion cell apparatus is remarkably simple to operate; the system is supplied with:

Water heater & Water circulation system with digital temperature controller and water level indicator.

Six stage magnetic stirrer with digital RPM indicator.

Cell holders.

Teflon coated stirring bars.

Diffusion Cells.

Diffusion Cell Apparatus Manufacturer, Diffusion Cell Apparatus Suppliers, Diffusion Cell Apparatus India, Diffusion Cell Apparatus Exporter, buy Diffusion Cell Apparatus, Educational School Lab Equipments, Diffusion Cell Apparatus India, Electronics, Diffusion Cell Apparatus India, buy Diffusion Cell Apparatus Online India.

Features:-

Magnetics Stirrer with stainless steel body to avoid corrosion.

Precise speed control over stirring range 200-800 rpm using digital speed indicator and controller.

Highly accurate stirring speed and temperature controller.

Digital Temperature controller for precise temperature control.

Water Circulation System with water level sensors to avoid damage to heating element.
