Arteries with Heart Models

Description

Arteries With Heart Models

This artery model is an oversized "Y" section of an artery, with cut-away.

The artery model displays a gradual build-up of cholesterol deposits.

The model also comes with an educational card which your patients or students can use to help them better understand the anatomy of the artery.

We offer arteries with heart models that are widely used to explain the function of artery and hearts to the students.

Our models provide the best way of understanding the functions of these parts, which are explained with the help of different colour combination.
