

Product Code . JL-TWL-9120

Thermal Conductivity of Metal Rod

Description

Thermal Conductivity of Metal Rod

Description:-

The experimental set up consists of a metal bar, one end of which is heated by an electric heater while the other end of the bar projects inside the cooling water jacket.

Heat Input to the heater is given through variac.

The temperature of the bar is measured in different sections.

By varying the heat input rates, data can be obtained.

A cylindrical shell filled with insulating material surrounds the middle portion of the bar.

Water at a constant rate is circulated through the jacket and its flow rate and temperature rise are noted.

Experimentation:-

To plot the temperature distribution along the length of Bar.

To determine the thermal conductivity of given bar at various temperatures.

Contact JLab Export for your Educational School Science Lab Equipments. We are best school science lab equipments suppliers in india, school science lab instruments, school science lab instruments exporter, school science lab instruments manufacturer, school scientific equipments, science educational equipment.
