## Pneumatic Air Brake Trainer

### Description

---

#### Pneumatic Air Brake Trainer

The Pneumatic Air Brake Trainer should provide a comprehensive system whereby the student may study and understand the principles, operational theory and maintenance of air brake systems found on trucks or large vehicles.

The unit should consist of original International branded heavy duty truck pneumatic braking components, which should be mounted onto separate (Truck and Trailer) integrated floor stands, made from powder coated electro galvanized steel, that are mounted onto wheels for mobility.

Air hoses should have a quick connection system, allowing for easy connections and experiments.

A color coded schematic chart, under a lexon poly carbonate protective screen, of the brake system and circuit, should also be mounted onto the trainer for reference.
